When a player opens a Limbo game, they configure two main parameters:

2. **The Target Multiplier:** The payout multiplier they wish to accomplish (e.g., 2x, 10x, 100x, or perhaps as much as 1,000,000 x).

Once these are set, the player initiates the round. The game generates a random number. If the generated number is **higher than or equal to** the target multiplier, the gamer wins their bet multiplied by that target. If the created number fails, the bet is lost.

Before a bet is positioned, the casino generates a hashed variation of the winning outcome. After the round concludes, gamers can confirm the math to guarantee the gambling establishment did not control the result.
