

Spreads advertised on a broker's homepage rarely match what you actually get during real trading hours. That 0.1 pip figure on EUR/USD often applies only during peak London-New York overlap, and even then it's the best-case number they're allowed to advertise. Check the average spread during Asian trading hours instead — that's when most Malaysian traders are actually online.

Execution model matters more than people think Market maker versus ECN isn't just technical jargon. Market makers take the other side of your trade sometimes, which creates a conflict of interest that's legal but worth knowing about. ECN brokers route orders to liquidity providers directly, usually with tighter spreads but a commission tacked on. Neither is automatically better — depends what you're trading and how often. Minimum deposit requirements vary wildly between brokers serving this region. Some let you start with \$10, others want \$500 minimum for standard accounts. Lower isn't always friendlier though — cheap entry sometimes comes bundled with worse spreads or limited instrument access. Leverage caps differ by broker, not by law Since Malaysia doesn't tightly regulate offshore forex brokers, leverage limits come from the broker's home jurisdiction, not local rules. You'll see anywhere from 1:30 to 1:1000 depending on where the broker is licensed. Higher leverage sounds appealing until a losing streak reminds you why it exists as a warning, not a feature. Withdrawal processing time tells you more about a broker's legitimacy than almost anything else on their website. A broker that processes withdrawals within 24 [forex broker reliability Malaysia](#) hours consistently is signaling something different than one that takes two weeks and requires three follow-up emails. Forums and review sites usually surface this pattern faster than official reviews do. Account currency options Trading in MYR-denominated accounts avoids repeated conversion costs, but not every broker offers this. Some force USD or EUR base currencies regardless of where you're trading from, which quietly nibbles at profits over time through conversion spreads. Negative balance protection isn't universal either. During extreme volatility — a flash crash, an unexpected rate announcement — accounts without this protection can end up owing the broker money beyond the original deposit. Worth confirming this exists before committing serious capital, not after a bad week teaches the lesson the hard way.
